

New dimensions
in energy recycling (CHP).
Naturally with Huber.

huber

... doesn't waste a Watt of energy.

How chemical and pharmaceutical companies can optimise their energy balance through environmentally friendly thermoregulation with Huber.

The koala bear is a true master of the energy balance, it never expends a drop of energy more than it must. Similarly, innovative energy recycling (CHP) from Huber is particularly attractive for the pharmaceutical and chemical industries looking for large scale optimisation of their energy consumption.

Where primary energy in the form of steam has remained unused, the new concept from Huber allows this to be usefully applied for process thermoregulation. The combination of a plate heat exchanger station from the company "Spirax Sarco" combined with a Huber Unistat enables the useful energy in the form of steam to be recycled. The plate heat exchanger station extracts the heat from the steam and transfers the energy, perfectly controlled to the production process, where especially stable temperatures are required.

The result: Thermoregulation with a precision which has not been available to date; intelligent use of a freely available energy source; protection of the environment while optimising your energy (cost) balance.
